Chancen und Grenzen von KI im Berechtigungsmanagement

Prabhakar Mishra, CyberDesk

> 95%

Datenzugriff durch
menschliche und
nicht-menschliche
Identitäten ist
unsere größte
Schwachstelle.

KI-Agenten
machen alles nur
noch schlimmer.

KI ist die Lösung, um granular zu steuern, wer wie auf welche Daten zugreifen kann.

Ein Team,
ein Ziel:
Der Schutz Ihres
Datenzugriffs.

KI ermöglicht Just-in-Time (JIT) Datenzugriff

Autorisierung trifft Machine Learning

So revolutioniert Machine Learning die Autorisierung:

Anomalieerkennung

→ Erkennt ungewöhnliche Zugriffsmuster und löst automatisch Warnungen aus

Verhaltensanalyse

→ Lernt typische Nutzeraktivitäten, um Identitätsdiebstahl oder Insider-Bedrohungen frühzeitig zu erkennen

Manipulationserkennung bei Berechtigungen

→ Überwacht Änderungen an Zugriffsrechten in Echtzeit und meldet unautorisierte Zugriffe

Erkennung von Spoofing & Impersonation

→ Nutzt biometrische und verhaltensbasierte Daten zur Identifikation echter Nutzer

Kontextabhängige Zugriffskontrolle

→ Bewertet Standort, Gerät und Zeitpunkt für präzisere Zugriffsentscheidungen

Risikobasierte Authentifizierung

→ Dynamische Zugriffsanpassung auf Basis individueller Risikobewertungen

KI-Mitarbeiter entlasten die IT-Abteilung

Deep Learning basierte Zugriffskontrolle

Decision Making Process in Deep-Learning Based Access Control

POL-02- Finance Department Access Policy

Role-Based Access Permissions

3.1. Junior Financial Analyst

- Responsibilities: Data analysis, financial reporting, expense tracking.
- Access: Read-Only: Transaction logs, summary reports, and financial performance dashboards. No Access: Customer account details, personal information, or transaction authorizations.
- Restrictions: No download capabilities for sensitive data; access limited to view-only dashboards. Access to reports limited to non-personally identifiable information (PII).

3.2. Senior Financial Analyst

- Responsibilities: Comprehensive financial analysis, forecasting, budgeting.
- Access: Read/Write: Budgeting and forecasting tools, aggregated financial reports. Read-Only: General ledger, high-level customer segmentation data (no PII).
- Restrictions: No access to individual transaction data or customer PII. Restricted ability to export sensitive data (subject to audit trail tracking).

3.3. Financial Manager

- Responsibilities: Oversee budgeting, audits, and reporting; interact with internal auditors.
- Access: Read/Write: Departmental budgets, audit logs, forecasting applications, and financial reports. Read-Only: Aggregated customer data for financial trend analysis (no individual customer data).
- Restrictions: No direct access to customer PII or individual transaction details. Must route requests for sensitive data through Data Protection Officer (DPO) and obtain manager approval.

3.4. Compliance Officer (Finance)

- Responsibilities: Ensure financial regulatory compliance and audit preparation.
- Access: Read-Only: All financial data necessary for compliance audits, excluding individual customer PII. Restricted Access: Aggregate customer information for compliance reporting, without the ability to drill down to individual accounts.
- Restrictions: No write permissions to any financial records. Must log all access to compliance reports for audit tracking.

3.5. Finance Director

- Responsibilities: Oversee all finance department operations, strategic planning, high-level reporting.
- Access: Read/Write: Access to all financial reports, budgeting tools, forecasting applications, and audit logs. Restricted Access: Customer financial data on an aggregated level only.
- Restrictions: Can access customer data summaries for strategic reporting but cannot view individual customer details. All actions logged and auditable, with dual-authorization for sensitive actions.

Log Details

Critical

The user attempted to authorise security group ingress and create a security group in EC2. They also tried to describe instances and VPCs in EC2. Unauthorized attempts were made to list groups, policies and user on IAM.

Data Store: **Example Store** • Permissions Used: **C** **R** **U** **D** • Source: **One Drive**

24 Jan 2023 6:08 AM - 24 Jan 2023 7:19 AM • Duration: 35 mins

Summary Status

The user attempted 8 actions in total, of which 4 were successful and 4 were unauthorized. Unauthorized actions included attempts to list contents of S3 buckets and modify security group configurations. This pattern suggests potential misuse or compromised credentials.

Key Actions

Among the critical actions performed, the user successfully described EC2 instances and VPCs. However, multiple unauthorized attempts were made to create security group ingress rules and modify IAM policies. Such activities are typically restricted to administrative users.

Anomalies and Deviations for Best Practices

The user's behavior deviated from best practices by attempting administrative-level changes without proper authorization. Frequent unauthorized access attempts to sensitive AWS resources (e.g., S3 buckets, security groups) indicate either insufficient privilege management or a potential insider threat.
